There are many reasons to be curious about the way people learn, and the past several decades have seen an explosion of research that has important implications for individual learning, schooling, workforce training, and policy. In 2000, *How People Learn: Brain, Mind, Experience, and School: Expanded Edition* was published and its influence has been wide and deep. The report summarized insights on the nature of learning in school-aged children; described principles for the design of effective learning environments; and provided examples of how that could be implemented in the classroom. Since then, researchers have continued to investigate the nature of learning and have generated new findings related to the neurological processes involved in learning, individual and cultural variability related to learning, and educational technologies. In addition to expanding scientific understanding of the mechanisms of learning and how the brain adapts throughout the lifespan, there have been important discoveries about influences on learning, particularly sociocultural factors and the structure of learning environments. *How People Learn II: Learners, Contexts, and Cultures* provides a much-needed update incorporating insights gained from this research over the past decade. The book expands on the foundation laid out in the 2000 report and takes an in-depth look at the constellation of influences that affect individual learning. *How People Learn II* will become an indispensable resource to understand learning throughout the lifespan for educators of students and adults.

Though we live in a time when memory seems to be losing its hold on communities, memory remains central to personal, communal, and national identities. And although popular and public discourses from speeches to films invite a shared sense of the past, official sites of memory such as memorials, museums, and battlefields embody unique rhetorical principles. *Places of Public Memory: The Rhetoric of Museums and Memorials* is a sustained and rigorous consideration of the intersections of memory, place, and rhetoric. From the mnemonic systems inscribed upon ancient architecture to the roadside accident memorials that line America's highways, memory and place have always been deeply interconnected. This book investigates the intersections of memory and place through nine original essays written by leading memory studies scholars from the fields of rhetoric, media studies, organizational communication, history, performance studies, and English. The essays address, among other subjects, the rhetorical strategies of those vying for competing visions of a 9/11 memorial at New York City's Ground Zero; rhetorics of resistance embedded in the plans for an expansion of the National Civil Rights Museum; representations of nuclear energy--both as power source and weapon--in Cold War and post-Cold War museums; and tours and tourism as acts of performance. By focusing on "official" places of memory, the collection causes readers to reflect on how nations and local communities remember history and on how some voices and views are legitimated and others are minimized or erased.

The brain ... There is no other part of the human anatomy that is so intriguing. How does it develop and function and why does it sometimes, tragically, degenerate? The answers are complex. In *Discovering the Brain*, science writer Sandra Ackerman cuts through the complexity to bring this vital topic to the public. The 1990s were declared the "Decade of the Brain" by former President Bush, and the neuroscience community responded with a host of new investigations and conferences. *Discovering the Brain* is based on the Institute of Medicine conference, Decade of the Brain: Frontiers in Neuroscience and Brain Research. *Discovering the Brain* is a "field guide" to the brain--an easy-to-read discussion of the brain's physical structure and where functions such as language and music appreciation lie. Ackerman examines How electrical and chemical signals are conveyed in the brain. The mechanisms by which we see, hear, think, and pay attention--and how a "gut feeling" actually originates in the brain. Learning and memory retention, including parallels to computer memory and what they might tell us about our own mental capacity. Development of the brain throughout the life span, with a look at the aging brain. Ackerman provides an enlightening chapter on the connection between the brain's physical condition and various mental disorders and notes what progress can realistically be made toward the prevention and treatment of stroke and other ailments. Finally, she explores the potential for major advances during the "Decade of the Brain," with a look at medical imaging techniques--what various technologies can and cannot tell us--and how the public and private sectors can contribute to continued advances in neuroscience. This highly readable volume will provide the public and policymakers--and many scientists as well--with a helpful guide to understanding the many discoveries that are sure to be announced throughout the "Decade of the Brain."
